

Project Design Phase Solution Architecture

Date	6 July 2026
Team ID	
Project Name	CAB BOOKING
Maximum Marks	4 Marks

Solution Architecture:

The RideReady Cab Booking System is developed using the MERN Stack (MongoDB, Express.js, React.js, and Node.js). It provides a secure and efficient platform for passengers and drivers. The architecture follows a client-server model where the React frontend communicates with the Express/Node.js backend through REST APIs, while MongoDB stores all application data.

Goals

- Provide a fast and secure cab booking platform.
- Enable user and driver authentication.
- Manage ride booking and ride history.
- Store user, driver, and ride information securely.
- Build a scalable and responsive application.

Example - Solution Architecture Diagram:
